**Abstract.** In this paper we present  $\theta$ -semigeneralized pre-open maps,  $\theta$ -semigeneralized pre-closed maps, pre- $\theta$ -semigeneralized pre-open maps, pre- $\theta$ -semigeneralized pre-closed maps by employing  $\theta$ -sgp-closed sets. We also introduce higher separation axioms  $\theta$ -semigeneralized pre-regular spaces and  $\theta$ -semigeneralized pre-normal spaces using  $\theta$ -sgp-closed sets in topological spaces and we investigate some new characterizations of these mappings and higher separation axioms.

**Keywords:**  $\theta$ -sgp-open map,  $\theta$ -sgp-closed map, pre- $\theta$ -sgp-open map, pre- $\theta$ -sgp-closed map,  $\theta$ -sgp-regular space,  $\theta$ -sgp-normal space.

### 1. Introduction

Malghan [10] defined generalized closed functions and obtained the preservation theorems of normality and regularity. Recently Arya and Nour [2] defined generalized semi-open sets and used them to obtain some characterizations of s-normal spaces due to Maheshwari and Prasad [9]. Dorsett ([5], [6]) defined and studied the concepts of semi-normal spaces and semi-regular spaces respectively. Quite recently, Devi et al. [4] have introduced generalized semi-closed functions and shown that the continuous generalized semi-closed surjective image of a normal space is s-normal. Present authors [13] introduced the notion of  $\theta$ -sgp-closed set. Object of this article is to continue the study of  $\theta$ -sgp-closed sets by intercalating new classes of mappings called  $\theta$ -sgp-open map,  $\theta$ -sgp-closed map, pre- $\theta$ -sgp-open map, pre- $\theta$ -sgp-closed map, contra pre- $\theta$ -sgp-open map and contra pre- $\theta$ -sgp-closed map using  $\theta$ -sgp-open and  $\theta$ -sgp-closed sets and also defined

---

new spaces called  $\theta$ -sgp-regular and  $\theta$ -sgp-normal utilizing  $\theta$ -sgp-closed set. We also investigated properties and characterizations of above mappings and spaces.

## 2. Preliminaries

In this paper, no separation axioms are taken up on the notations  $(X, \tau)$  and  $(Y, \sigma)$  (or simply  $X$  and  $Y$ ) which stands for topological spaces except clearly stated. If  $M \subset X$  then  $Cl(M)$  and  $Int(M)$  stands for closure of  $M$  and the interior of  $M$  in  $X$  respectively.

We recall some definitions used in this paper to make it self-contained.

**Definition 2.1.** A subset  $A$  of a space  $X$  is called

- (i) a semi-open set [8] if  $A \subset Cl(Int(A))$ .
- (ii) a semi-closed set [2] if  $Int(Cl(A)) \subset A$ .
- (iii) a pre-open [11] if  $A \subseteq (Int(Cl(A)))$

**Definition 2.2.** The pre- $\theta$ -closure denoted by  $pCl_{\theta}(A)$ , is the set of all pre- $\theta$ -cluster points of  $A$ . A subset  $A$  is called pre- $\theta$ -closed set [1] if  $A = pCl_{\theta}(A)$ . The complement of pre- $\theta$ -closed set is pre- $\theta$ -open set.

**Definition 2.3.** A subset  $A$  of a topological space  $X$  is called  $\theta$ -semigeneralized pre-closed set [14] (briefly,  $\theta$ -sgp-closed) if  $pCl_{\theta}(A) \subset U$  whenever  $A \subset U$  and  $U$  is semi-open in  $X$ . The complement of  $\theta$ -semigeneralized pre-closed set is called  $\theta$ -semigeneralized pre-open (briefly,  $\theta$ -sgp-open).

**Definition 2.4.** A space  $X$  is said to be  $T_{\theta sgp}$  [16] if every  $\theta$ -sgp-closed set is semi-closed set.

**Definition 2.5.** A function  $f : X \rightarrow Y$  is called  $\theta$ -sgp-irresolute [16](resp., semi-totally semi-continuous [7],  $\theta$ -sgp-continuous [16], irresolute [3]) if  $f^{-1}(F)$  is  $\theta$ -sgp-closed (resp., both semi-open and semi-closed,  $\theta$ -sgp-closed, semi-closed) in  $X$  for every  $\theta$ -sgp-closed set (resp., semi-open set, semi-closed set, semi-closed set)  $F$  of  $Y$ .

**Definition 2.6.** For a subset  $A$  of  $X$ ,  $\theta$ -semigeneralized pre-closure [15] of  $A$ , denoted by  $\theta$ -sgpCl( $A$ ) and is defined as  $\theta$ -sgpCl( $A$ ) =  $\cap\{G : A \subseteq G, G$  is  $\theta$ -sgp-closed in  $X$  }.

**Definition 2.7.** [18] A space  $X$  is said to be:

- (i)  $\theta$ -sgp- $T_0$ , if for each pair  $x, y \in X$  and  $x \neq y$ , there is a  $\theta$ -sgp-open set containing one point but not the other.
- (ii)  $\theta$ -sgp- $T_1$ , if for each pair of unequal points  $x, y \in X$ , there are disjoint  $\theta$ -sgp-open sets  $U$  and  $V$  such that  $x \in U, y \notin U$  and  $y \in V, x \notin V$ .
- (iii)  $\theta$ -sgp- $T_2$ , if for each pair of unequal points  $x, y \in X$ , there are disjoint  $\theta$ -sgp-open sets  $U$  and  $V$  such that  $x \in U, y \in V$  and  $U \cap V = \phi$ .

### 3. $\theta$ -sgp-open and $\theta$ -sgp-closed mappings

**Definition 3.1.** Let  $f : X \rightarrow Y$  be a map. Then  $f$  is called  $\theta$ -sgp-open (resp.,  $\theta$ -sgp-closed) if  $f(M)$  is  $\theta$ -sgp-open set (resp.,  $\theta$ -sgp-closed set) in  $Y$  for every semi-open set (resp., semi-closed set)  $M$  in  $X$ .

**Theorem 3.2.** A map  $f : X \rightarrow Y$  is  $\theta$ -sgp-closed if and only if for each subset  $P$  of  $Y$  and for each semi-open set  $Q$  containing  $f^{-1}(P)$  there is a semi-open set  $R$  of  $Y$  such that  $P \subseteq R$  and  $f^{-1}(R) \subseteq Q$ .

**Proof.** Assume that  $f$  is  $\theta$ -sgp-closed map. Let  $P$  be a subset of  $Y$  and  $Q$  be a semi-open set of  $X$  such that  $P \subseteq f(Q)$ , that is  $f^{-1}(P) \subseteq Q$ . Now  $Q^c$  is semi-closed set in  $X$ . Then  $f(Q^c)$  is  $\theta$ -sgp-closed in  $Y$ , since  $f$  is  $\theta$ -sgp-closed map. So,  $Y - f(Q^c)$  is  $\theta$ -sgp-open in  $Y$ . Thus  $R = Y - f(Q^c)$  is a  $\theta$ -sgp-open set containing  $P$  such that  $f^{-1}(R) \subseteq Q$ .

Conversely, suppose that  $f$  is  $\theta$ -sgp-closed map. Let  $F$  be a semi-closed set in  $X$ . Then  $f^{-1}(Y - f(F)) \subseteq X - F$  and  $X - F$  is semi-open. By hypothesis, there is a  $\theta$ -sgp-open set  $R$  of  $Y$  such that  $Y - f(F) \subseteq R$  and  $f^{-1}(R) \subseteq X - F$  and so  $F \subseteq X - f^{-1}(R)$ . Hence  $Y - R \subseteq f(F) \subseteq f(X - f^{-1}(R)) \subseteq Y - R$  which implies  $f(F) = Y - R$ . Since  $Y - R$  is  $\theta$ -sgp-closed,  $f(F)$  is  $\theta$ -sgp-closed and thus  $f$  is  $\theta$ -sgp-closed map.

**Theorem 3.3.** If  $f : X \rightarrow Y$  is irresolute, pre- $\theta$ -closed and  $B$  is  $\theta$ -sgp-closed subset of  $X$ , then  $f(B)$  is  $\theta$ -sgp-closed in  $Y$ .

**Proof.** Let  $M$  be a semi-open set in  $Y$  such that  $f(B) \subseteq M$ . Since  $f$  is irresolute,  $f^{-1}(M)$  is a semi-open set containing  $B$ , that is  $B \subseteq f^{-1}(M)$ . Hence  $pCl_\theta(B) \subseteq f^{-1}(M)$ , as  $B$  is  $\theta$ -sgp-closed in  $X$ . Since  $f$  is pre- $\theta$ -closed,  $f(pCl_\theta(B))$  is pre- $\theta$ -closed. So,  $f(pCl_\theta(B))$  is a  $\theta$ -sgp-closed set contained in the semi-open set  $M$ , that is  $f(pCl_\theta(B)) \subseteq M$ . Now  $pCl_\theta(f(B)) \subseteq pCl_\theta(f(pCl_\theta(B))) = f(pCl_\theta(B)) \subseteq M$ . Hence  $pCl_\theta(f(B)) \subseteq M$ . Therefore  $f(B)$  is  $\theta$ -sgp-closed set in  $Y$ .

**Remark 3.4.** The composition of two  $\theta$ -sgp-closed maps need not be  $\theta$ -sgp-closed as seen from the following example.

**Example 3.5.** Let  $X=Y=Z=\{p, q, r\}$ ,  $\tau = \{\phi, \{p\}, \{q\}, \{p, q\}, X\}$ ,  $\sigma = \{\phi, \{p\}, \{q, r\}, Y\}$  and  $\eta = \{\phi, \{p, q\}, Z\}$ . Let  $f : X \rightarrow Y$  be the identity map and define  $g : Y \rightarrow Z$  by  $g(p) = g(q) = r$  and  $g(r) = p$ . Then both  $f$  and  $g$  are  $\theta$ -sgp-closed maps but their composition  $g \circ f : X \rightarrow Z$  is not  $\theta$ -sgp-closed map. Since for semi-closed set  $\{r\}$  in  $X$ ,  $(g \circ f)(\{r\}) = g(f(\{r\})) = \{p\}$  which is not  $\theta$ -sgp-closed set in  $Z$ .

**Corollary 3.6.** Let  $f : X \rightarrow Y$  be a  $\theta$ -sgp-closed map and  $g : Y \rightarrow Z$  be pre- $\theta$ -closed and irresolute, then their composition  $g \circ f : X \rightarrow Z$  is  $\theta$ -sgp-closed.

**Proof.** Let  $B$  be a semi-closed set of  $X$ . Then by hypothesis  $f(B)$  is  $\theta$ -sgp-closed in  $Y$ . Since  $g$  is pre- $\theta$ -closed and irresolute, by theorem 3.3,  $g(f(B)) = (g \circ f)(B)$  is  $\theta$ -sgp-closed in  $Z$ . Hence  $(g \circ f)$  is  $\theta$ -sgp-closed.

**Theorem 3.7.** Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  be  $\theta$ -sgp-closed maps and  $Y$  be a  $T_{\theta sgp}$ . Then their composition  $(g \circ f)$  is  $\theta$ -sgp-closed.

**Proof.** Let  $D$  be a semi-closed set of  $X$ . Then by hypothesis  $f(D)$  is a  $\theta$ -sgp-closed in  $Y$ . Since  $Y$  is a  $T_{\theta sgp}$ ,  $f(D)$  is semi-closed in  $Y$ . Also by assumption  $g(f(D))$  is  $\theta$ -sgp-closed in  $Z$ . Hence  $(g \circ f)$  is  $\theta$ -sgp-closed.

**Theorem 3.8.** Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  be two maps such that their composition  $g \circ f : X \rightarrow Z$  is a  $\theta$ -sgp-open. Then the following statements are true.

- (i) If  $f$  is semi-totally semi-continuous and surjective, then  $g$  is  $\theta$ -sgp-open.
- (ii) If  $g$  is  $\theta$ -sgp-irresolute and injective, then  $f$  is  $\theta$ -sgp-open.

**Proof.** (i) Let  $D$  be a semi-open set in  $Y$ . Then  $f^{-1}(D)$  is both semi-open and semi-closed in  $X$  as  $f$  is semi-totally semi-continuous. Since  $(g \circ f)$  is  $\theta$ -sgp-open map and  $f$  is surjective,  $(g \circ f)(f^{-1}(D)) = g(D)$  is  $\theta$ -sgp-open set in  $Z$ . Therefore  $g$  is a  $\theta$ -sgp-open in  $X$ .

(ii) Let  $H$  be a semi-open set of  $X$ . Since  $(g \circ f)$  is  $\theta$ -sgp-open,  $(g \circ f)(H)$  is a  $\theta$ -sgp-open set in  $Z$ . Since  $g$  is  $\theta$ -sgp-irresolute,  $g^{-1}((g \circ f)(H)) = g^{-1}(g(f(H))) = f(H)$  is  $\theta$ -sgp-open set in  $Y$ , since  $g$  is injective. Thus  $f$  is a  $\theta$ -sgp-open in  $X$ .

**Theorem 3.9.** For any bijection  $f : X \rightarrow Y$  the following statements are identical:

- (i)  $f^{-1}$  is  $\theta$ -sgp-continuous.
- (ii)  $f$  is a  $\theta$ -sgp-open map.
- (iii)  $f$  is a  $\theta$ -sgp-closed map.

**Proof.** (i)  $\rightarrow$  (ii) : Let  $Q$  be a semi-open set of  $X$ . By assumption  $(f^{-1})^{-1}(Q) = f(Q)$  is  $\theta$ -sgp-open set in  $Y$  and so  $f$  is  $\theta$ -sgp-open map.

(ii)  $\rightarrow$  (iii) : Let  $P$  be a semi-closed set of  $X$ . Then  $P^c$  is semi-open in  $X$ . By assumption  $f(P^c)$  is  $\theta$ -sgp-open set in  $Y$ , that is  $f(P^c) = (f(P))^c$   $\theta$ -sgp-open set in  $Y$  and therefore  $f(P)$  is  $\theta$ -sgp-closed set in  $Y$ . Hence  $f$  is  $\theta$ -sgp-closed map.

(iii)  $\rightarrow$  (i) : Let  $P$  be a semi-closed set of  $X$ . By assumption  $f(P)$  is  $\theta$ -sgp-closed set in  $Y$ . But  $(f^{-1})^{-1}(P) = f(P)$  and therefore  $f$  is  $\theta$ -sgp-continuous.

**Theorem 3.10.** If  $f : X \rightarrow Y$  is semi-open,  $\theta$ -sgp-irresolute onto and  $M$  is a  $\theta$ -sgp-closed set in  $Y$ , then  $f^{-1}(M)$  is a  $\theta$ -sgp-closed set in  $X$ .

**Proof.** Let  $J$  be any semi-open set of  $X$  containing  $f^{-1}(M)$ . Then  $M \subset f(J)$  and  $f(J)$  is semi-open in  $Y$ . Since  $M$  is  $\theta$ -sgp-closed set in  $Y$ ,  $pCl_{\theta}(M) \subset f(J)$  and hence  $f^{-1}(M) \subset f^{-1}(pCl_{\theta}(M)) \subset J$ . Since  $f$  is  $\theta$ -sgp-irresolute,  $f^{-1}(pCl_{\theta}(M))$  is  $\theta$ -sgp-closed in  $X$  and hence we have  $pCl_{\theta}(f^{-1}(M)) \subset f^{-1}(pCl_{\theta}(M)) \subset J$ . This shows that  $f^{-1}(M)$  is  $\theta$ -sgp-closed set in  $X$ .

**Theorem 3.11.** If  $f : X \rightarrow Y$  is onto,  $\theta$ -sgp-open. If  $X$  is  $\theta$ -sgp- $T_1$  and  $T_{\theta sgp}$ , then  $Y$  is  $\theta$ -sgp- $T_1$ .

**Proof.** Let  $m_1$  and  $m_2$  be two points of  $Y$ . Since  $f$  is onto, there exist distinct points  $n_1$  and  $n_2$  of  $X$  such that  $f(n_1) = m_1$  and  $f(n_2) = m_2$ . Since  $X$  is a  $\theta$ -sgp- $T_1$ , there exist  $\theta$ -sgp-open sets  $J$  and  $K$  such that  $n_1 \in J$  and  $n_2 \notin J$  and  $n_2 \in K$  and  $n_1 \notin K$ . Again since  $X$  is  $T_{\theta sgp}$ ,  $J$  and  $K$  are semi-open sets in  $X$ . As  $f$  is  $\theta$ -sgp-open map,  $f(J)$  and  $f(K)$  are  $\theta$ -sgp-open sets such that  $m_1 = f(n_1) \in f(J)$ ,  $m_2 = f(n_2) \notin f(J)$  and  $m_1 = f(n_1) \notin f(K)$ ,  $m_2 = f(n_2) \in f(K)$ . Hence  $Y$  is  $\theta$ -sgp- $T_1$ .

#### 4. Pre- $\theta$ -sgp-closed and pre- $\theta$ -sgp-open mappings

**Definition 4.1.** A map  $f : X \rightarrow Y$  is called pre- $\theta$ -sgp-closed (resp., pre- $\theta$ -sgp-open) if  $f(M)$  is  $\theta$ -sgp-closed (resp.,  $\theta$ -sgp-open) in  $Y$  for every  $\theta$ -sgp-closed (resp.,  $\theta$ -sgp-open) set  $M$  of  $X$ .

**Theorem 4.2.** If  $f : X \rightarrow Y$  is semi-totally semi-continuous, pre- $\theta$ -sgp-closed and  $N$  is a  $\theta$ -sgp-closed subset of  $X$ , then  $f(N)$  is  $\theta$ -sgp-closed set in  $Y$ .

**Proof.** Let  $M$  be a semi-open set such that  $f(N) \subseteq M$ . Since  $f$  is semi-totally semi-continuous  $f^{-1}(M)$  is a semi-open set containing  $N$ , that is  $N \subseteq f^{-1}(M)$ . Hence  $pCl_{\theta}(N) \subseteq f^{-1}(M)$  as  $N$  is  $\theta$ -sgp-closed set in  $X$ . Since  $f$  is pre- $\theta$ -sgp-closed,  $f(pCl_{\theta}(N))$  is  $\theta$ -sgp-closed set. So  $f(pCl_{\theta}(N))$  is  $\theta$ -sgp-closed set contained in semi-open set  $M$ , that is  $f(pCl_{\theta}(N)) \subseteq M$ . Now  $pCl_{\theta}(f(N)) \subseteq pCl_{\theta}(f(\theta - sgpCl(N))) \subseteq pCl_{\theta}(f(pCl_{\theta}(N))) = f(pCl_{\theta}(N)) \subseteq M$ . Hence  $pCl_{\theta}(f(N)) \subseteq M$ . Therefore  $f(N)$  is a  $\theta$ -sgp-closed set in  $Y$ .

**Theorem 4.3.** The property of a space being  $\theta$ -sgp- $T_0$  is preserved under one-one, onto, pre- $\theta$ -sgp-open map and hence is a topological property.

**Proof.** Let  $X$  be a  $\theta$ -sgp- $T_0$ -space and  $Y$  be any other topological space. Let  $f : X \rightarrow Y$  be one-one, onto, pre- $\theta$ -sgp-open map from  $X$  to  $Y$ . Let  $y_1, y_2 \in Y$  with  $y_1 \neq y_2$  and since  $f$  is one-one, onto, there exist distinct points  $x_1, x_2 \in X$  such that  $f(x_1) = y_1, f(x_2) = y_2$ . Since  $X$  is  $\theta$ -sgp- $T_0$ , there exists a  $\theta$ -sgp-open set  $J$  in  $X$  such that  $x_1 \in J$  but  $x_2 \notin J$ . Since  $f$  is pre- $\theta$ -sgp-open map,  $f(J)$  is  $\theta$ -sgp-open set containing  $f(x_1)$  but not containing  $f(x_2)$ . Thus there exist a  $\theta$ -sgp-open set  $f(J)$  in  $Y$  such that  $y_1 \in f(J)$  but  $y_2 \notin f(J)$  and hence  $Y$  is  $\theta$ -sgp- $T_0$ . Again as the property of being  $\theta$ -sgp- $T_0$  is preserved under one-one, onto map, it is also preserved under homeomorphism and hence is a topological property.

**Theorem 4.4.** Let  $f : X \rightarrow Y$  be a  $\theta$ -sgp-closed map and  $g : Y \rightarrow Z$  be a pre- $\theta$ -sgp-closed map and semi-totally semi-continuous, then their composition  $g \circ f : X \rightarrow Z$  is  $\theta$ -sgp-closed.

**Proof.** Let  $K$  be a semi-closed set in  $X$ . Then by hypothesis  $f(K)$  is  $\theta$ -sgp-closed set  $Y$ . Since  $g$  is pre- $\theta$ -sgp-closed map and semi-totally semi-continuous, by Theorem 4.2  $g(f(K)) = (g \circ f)(K)$  is  $\theta$ -sgp-closed set in  $Z$ . Hence  $(g \circ f)$  is  $\theta$ -sgp-closed.

**Definition 4.5.** A map  $f : X \rightarrow Y$  is called contra pre- $\theta$ -sgp-open if for every  $\theta$ -sgp-open set  $O$  of  $X$ ,  $f(O)$  is  $\theta$ -sgp-closed set in  $Y$ .

**Definition 4.6.** A map  $f : X \rightarrow Y$  is called contra pre- $\theta$ -sgp-closed if for every  $\theta$ -sgp-closed set  $F$  of  $X$ ,  $f(F)$  is  $\theta$ -sgp-open set in  $Y$ .

The following examples show that contra pre- $\theta$ -sgp-closedness and contra pre- $\theta$ -sgp-openness are independent.

**Example 4.7.** Let  $X=Y= \{p, q, r\}$ ,  $\tau = \{X, \phi, \{p\}, \{q\}, \{p, q\}, \{p, r\}, \{q, r\}\}$  and  $\sigma = \{Y, \phi, \{p\}, \{q\}, \{p, q\}\}$ . We have  $\theta$ -sgp-open sets in  $X$  are  $\{X, \{p\}, \{q, r\}\}$  and  $\theta$ -sgp-open sets in  $Y$  are  $\{Y, \{p\}, \{q\}, \{p, r\}, \{q, r\}\}$ . Let  $f : X \rightarrow Y$  is defined by  $f(p) = f(r) = r$ ,  $f(q) = q$  and  $g : X \rightarrow Y$  is by  $g(p) = g(q) = p$ ,  $g(r) = q$ . Then  $f$  is contra pre- $\theta$ -sgp-open but not contra pre- $\theta$ -sgp-closed and  $g$  is contra pre- $\theta$ -sgp-closed but not contra pre- $\theta$ -sgp-open.

**Remark 4.8.** Contra pre- $\theta$ -sgp-closedness and contra pre- $\theta$ -sgp-openness are equivalent if the map is onto.

**Theorem 4.9.** For a map  $f : X \rightarrow Y$  the following properties are equivalent:

- (i)  $f$  is contra pre- $\theta$ -sgp-open.
- (ii) For every subset  $D$  of  $Y$  and for every  $\theta$ -sgp-closed subset  $E$  of  $X$  with  $f^{-1}(D) \subseteq E$ , there exists a  $\theta$ -sgp-open subset  $G$  of  $Y$  with  $D \subseteq G$  and  $f^{-1}(G) \subseteq E$ .
- (iii) For every point  $q \in Y$  and every  $\theta$ -sgp-closed subset  $E$  of  $X$  with  $f^{-1}(q) \subseteq E$ , there exists a  $\theta$ -sgp-open subset  $G$  of  $Y$  with  $q \in G$  and  $f^{-1}(G) \subseteq E$ .

**Proof.** (i)  $\rightarrow$  (ii): Let  $D$  be a subset of  $Y$  and let  $E$  be a  $\theta$ -sgp-closed subset of  $X$  with  $f^{-1}(D) \subseteq E$ . For the case  $D \neq \phi$ , put  $G = [f(E^c)]^c$ . Then  $f^{-1}(G) = [f^{-1}(E^c)]^c \subseteq E$  and  $G$  is a  $\theta$ -sgp-open subset of  $Y$ . We claim that  $D \subseteq G$ . There are two cases to be considered.

Case 1:  $f^{-1}(D) \neq \phi$ . Since  $f^{-1}(D) \subseteq E$ , we have  $f(E^c) \subseteq D^c$  and  $D \subseteq G$ .

Case 2:  $f^{-1}(D) = \phi$ . Since  $f^{-1}(D) = \phi \subseteq E$ , we have  $f(E^c) \subseteq f(X)$ . We have  $D \cap f(X) = \phi$ , because  $f^{-1}(D) = \phi$  and  $D \neq \phi$ . Thus  $D \subseteq [f(X)]^c \subseteq [f(E^c)]^c = G$ . For the case  $D = \phi$ , put  $G = \phi$ . Then the set  $G$  is required  $\theta$ -sgp-open of  $Y$ .

(ii)  $\rightarrow$  (iii) : It suffices to put  $D=q$ , in (ii).

(iii)  $\rightarrow$  (i): Let  $H$  be a  $\theta$ -sgp-open subset of  $X$ . Then  $q \in [f(H)]^c$  and  $E = H^c$ . First we claim that  $f^{-1}(q) \subset E$ . For non empty set  $f^{-1}(q)$ , let  $p \in f^{-1}(q)$ ;  $f(p) = q \notin f(H)$ . Suppose that  $p \notin H$  and so  $q = f(p) \in f(H)$ . By contradiction,  $p \in E$  for any  $p \in f^{-1}(q)$ , that is  $f^{-1}(q) = \phi \subseteq E$ . For the case where  $f^{-1}(q) = \phi$ , we have  $f^{-1}(q) = \phi \subseteq E$ . For both cases, we can use (iii) and get the following: there exists a  $\theta$ -sgp-open set  $G_q \subseteq Y$  such that  $q \in G_q$  and  $f^{-1}(G_q) \subseteq E = H^c$ . Namely,  $(\star) f^{-1}(G_q) \cap H = \phi$  holds for each  $q \in [f(H)]^c$ . Finally we claim that  $[f(H)]^c \subseteq \bigcup \{G_q : q \in [f(H)]^c\}$ . Obviously, we have that  $[f(H)]^c \subseteq \bigcup \{G_q : q \in [f(H)]^c\}$

Conversely, let  $p \in \bigcup \{G_q : q \in [f(H)]^c\}$ . Then there exists a point  $r \in [f(H)]^c$  such that  $p \in G_r$ . Suppose that  $p \notin [f(H)]^c$ . Then  $p \in f(H)$  and there exists a point  $b \in H$  such that  $f(b)=p$ . Thus we have that  $f(b) \in G_r$  and so  $b \in f^{-1}(G_r)$ . We have a contradiction to  $(\star)$  above, that is  $b \in f^{-1}(G_r) \cap H$ . Hence, we show that  $\bigcup \{G_q : q \in [f(H)]^c\} \subseteq [f(H)]^c$  and so  $[f(H)]^c = \bigcup \{G_q : q \in [f(H)]^c\}$ . Hence  $f(H)$  is a  $\theta$ -sgp-closed subset of  $Y$ .

### 5. $\theta$ -sgp-regular and $\theta$ -sgp-normal spaces

**Definition 5.1.** A topological space  $X$  is said to be  $\theta$ -sgp-regular if for every  $\theta$ -sgp-closed set  $P$  and each point  $x$  which is not in  $P$ , there exist disjoint semi-open sets  $M$  and  $N$  such that  $x \in M, P \subseteq N$  and  $M \cap N = \phi$ .

**Definition 5.2.** A topological space  $X$  is said to be  $\theta$ -sgp-normal if for every pair of disjoint  $\theta$ -sgp-closed sets  $P_1$  and  $P_2$  in  $X$ , there exist disjoint semi-open sets  $M$  and  $N$  such that  $P_1 \subseteq M, P_2 \subseteq N$  and  $M \cap N = \phi$ .

**Theorem 5.3.** Let  $X$  be a topological space. Then the following statements are identical: (i)  $X$  is  $\theta$ -sgp-regular.

(ii) For each point  $x \in X$  and for each  $\theta$ -sgp-open nbd  $Z$  of  $x$ , there exists a semi-open set  $Q$  of  $x$  such that  $pCl_\theta(Q) \subseteq Z$ .

(iii) For each point  $x \in X$  and for each  $\theta$ -sgp-closed not containing  $x$ , there exists a semi-open set  $Q$  of  $x$  such that  $pCl_\theta(Q) \cap F = \phi$ .

**Proof.** Let  $Z$  be a  $\theta$ -sgp-open nbd of  $x$ . Then there exists a  $\theta$ -sgp-open set  $K$  such that  $x \in K \subseteq Z$ . Since  $K^c$  is  $\theta$ -sgp-closed set and  $x \notin K^c$ , by hypothesis there exist semi-open sets  $P$  and  $Q$  such that  $K^c \subseteq P, x \in Q$  and  $P \cap Q = \phi$  and so  $Q \subseteq P^c$ . Now  $pCl_\theta(Q) \subseteq pCl_\theta(P^c) = P^c$  and  $K^c \subseteq P$  implies  $P^c \subseteq K \subseteq Z$ . Therefore  $pCl_\theta(Q) \subseteq Z$ . Hence (i) implies (ii).

Let  $F$  be any  $\theta$ -sgp-closed set and  $x \notin F$ . Then  $x \notin F^c$  and  $F^c$  is  $\theta$ -sgp-open and so  $F^c$  is a  $\theta$ -sgp-open nbd of  $x$ . By hypothesis, there exists a semi-open set  $Q$  of  $x$  such that  $x \in Q$  and  $pCl_\theta(Q) \subseteq F^c$ , which implies  $F \subseteq (pCl_\theta(Q))^c$ . Then  $(pCl_\theta(Q))^c$  is a semi-open set containing  $F$  and  $Q \cap (pCl_\theta(Q))^c = \phi$ . Therefore  $X$  is  $\theta$ -sgp-regular. Hence (ii) implies (i).

Let  $x \in X$  and  $F$  be a  $\theta$ -sgp-closed set such that  $x \notin F$ . Then  $F^c$  is a  $\theta$ -sgp-open nbd of  $x$  and by hypothesis there exists a semi-open set  $Q$  of  $x$  such that  $pCl_\theta(Q) \subseteq F^c$  and therefore  $pCl_\theta(Q) \cap F = \phi$ . Hence (ii) implies (iii).

Let  $x \in X$  and  $Z$  be a  $\theta$ -sgp-open nbd of  $x$ . Then there exists a  $\theta$ -sgp-open set  $K$  such that  $x \in K \subseteq Z$ . Since  $K^c$  is  $\theta$ -sgp-closed set and  $x \notin K^c$ , by hypothesis there exist semi-open set  $Q$  of  $x$  such that  $pCl_\theta(Q) \cap K^c = \phi$ . Therefore  $pCl_\theta(Q) \subseteq K \subseteq Z$ . Hence (iii) implies (ii).

**Theorem 5.4.** A space  $X$  is a  $\theta$ -sgp-regular if and only if given any  $x \in X$  and any semi-open set  $B$  of  $X$  there is  $\theta$ -sgp-open set  $C$  such that  $x \in C \subseteq \theta - sgpCl(C) \subseteq B$ .

**Proof.** Let  $B$  be a semi-open set,  $x \in B$ . So  $B^c$  is semi-closed set such that  $x \notin B^c$ . Since  $X$  is a  $\theta$ -sgp-regular then there exist  $\theta$ -sgp-open sets  $C_1$  and  $C_2$  such that  $C_1 \cap C_2 = \phi$ ,  $B^c \subset C_2, x \in C_1$ . Since  $C_1 \cap C_2 = \phi$ , we have  $\theta - sgpCl(C_1) \subset \theta - sgpCl(C_2) = C_2^c$ . Since  $B^c \subset C_2$ , we have  $C_2^c \subset B$ . Hence we have  $x \in C_1 \subset \theta - sgpCl(C_1) \subset C_2^c \subseteq B$ .

Conversely, let  $F$  be a semi-closed set in  $X$  and  $x \in X - F$ . So  $F^c$  is a semi-open set such that  $x \in F^c$ . Hence there exist a  $\theta$ -sgp-open set  $B$  such that  $x \in B \subset \theta - sgpCl(B) \subseteq F^c$ . Let  $C = X - \theta\text{-sgpCl}(B)$ . So  $C$  is a  $\theta$ -sgp-open set which contains  $F$  and  $B \cap C = \phi$ . Hence  $X$  is  $\theta$ -sgp-regular.

**Theorem 5.5.** Let  $X$  be a topological space. If  $X$  is a  $\theta$ -sgp-regular and  $T_1$  then  $X$  is a  $\theta$ -sgp- $T_2$ .

**Proof.** Suppose  $x, y \in X$  such that  $x \neq y$ . Since  $X$  is  $T_1$  then there is an open set  $M$  such that  $x \in M, y \notin M$ . Since  $X$  is  $\theta$ -sgp-regular and  $M$  is semi-open set which contains  $x$ , then there is  $\theta$ -sgp-open set  $N$  such that  $x \in N \subset \theta - sgpCl(N) \subseteq M$ . Since  $y \notin M$ , hence  $y \notin \theta\text{-sgpCl}(N)$ . Therefore  $y \in X - (\theta\text{-sgpCl}(N))$ . Hence there are  $\theta$ -sgp-open sets  $N$  and  $X - (\theta\text{-sgpCl}(N))$  such that  $(X - (\theta\text{-sgpCl}(N))) \cap N = \phi$ . Hence  $X$  is a  $\theta$ -sgp- $T_2$ .

**Theorem 5.6.** Every subspace of  $\theta$ -sgp-regular space is  $\theta$ -sgp-regular.

**Proof.** Let  $X$  be a  $\theta$ -sgp-regular space and  $Y$  be a subspace of  $X$ . Let  $x \in Y$  and  $F$  be a  $\theta$ -sgp-closed set of  $Y$  such that  $x \notin F$ . Then there is a semi-closed set and so  $\theta$ -sgp-closed set  $A$  of  $X$  with  $F = Y \cap A$  and  $x \notin A$ . Since  $X$  is a  $\theta$ -sgp-regular, there exist semi-open sets  $K$  and  $L$  such that  $x \in K, A \subseteq L$  and  $K \cap L = \phi$ . Note that  $Y \cap K$  and  $Y \cap L$  are semi-open sets in  $Y$ . Also  $x \in K$  and  $x \in Y$  which implies  $x \in Y \cap K$  and  $A \subseteq L$ . This implies  $Y \cap A \subseteq Y \cap K, F \subseteq Y \cap L$ . Also  $(Y \cap K) \cap (Y \cap L) = \phi$ . Hence  $Y$  is a  $\theta$ -sgp-regular.

**Theorem 5.7.** If  $f : X \rightarrow Y$  is onto,  $\theta$ -sgp-irresolute and semi-open from  $\theta$ -sgp-regular space  $X$  into a topological space  $Y$ , then  $Y$  is  $\theta$ -sgp-regular.

**Proof.** Let  $y \in Y$  and  $F$  be a  $\theta$ -sgp-closed set of  $Y$  with  $y \notin F$ . Since  $f$  is  $\theta$ -sgp-irresolute,  $f^{-1}(F)$  is  $\theta$ -sgp-closed set in  $X$ . As  $f$  is onto, let  $f(x)=y$  and  $x = f^{-1}(y)$  and  $x \notin f^{-1}(F)$ . Again since  $X$  is  $\theta$ -sgp-regular space, there exist semi-open sets  $U$  and  $V$  such that  $x \in U$  and  $f^{-1}(F) \subseteq V$  and  $U \cap V = \phi$ . Since  $f$  is semi-open and onto, we have  $y \in f(U), F \subseteq f(V)$  and  $f(U) \cap f(V) = f(U \cap V) = f(\phi) = \phi$ . Hence  $Y$  is  $\theta$ -sgp-regular.

**Theorem 5.8.** If  $f : X \rightarrow Y$  is one-to-one,  $\theta$ -sgp-closed map from a topological space  $X$  into  $\theta$ -sgp-regular space  $Y$ . If  $X$  is  $T_{\theta\text{sgp}}$ , then  $X$  is  $\theta$ -sgp-regular.

**Proof.** Let  $x \in X$  and  $F$  be a  $\theta$ -sgp-closed set in  $X$  such that  $x \notin F$ . Since  $X$  is  $T_{\theta\text{sgp}}$ -space,  $F$  is semi-closed in  $X$ . Then  $f(F)$  is  $\theta$ -sgp-closed set with  $f(x) \notin f(F)$  in  $Y$  as  $f$  is  $\theta$ -sgp-closed. Again  $Y$  is  $\theta$ -sgp-regular, there exist disjoint semi-open sets  $U$  and  $V$  such that  $f(x) \in U$  and  $f(F) \subseteq V$ . Therefore  $x \in f^{-1}(U)$  and  $F \subset f^{-1}(V)$ . Hence  $X$  is  $\theta$ -sgp-regular.

**Theorem 5.9.** A topological space  $X$  is said to be  $\theta$ -sgp-normal if and only if for every semi-closed set  $F$  and for every semi-open set  $G$  contain  $F$  there exists  $\theta$ -sgp-open set  $U$  such that  $F \subset U \subset \theta - \text{sgpCl}(U) \subset G$ .

**Proof.** Let  $F$  be a semi-closed set in  $X$  and  $G$  be semi-open set in  $X$  such that  $F \subset G$ ,  $G^c$  is a semi-closed set and  $G^c \cap F = \phi$ . Since  $X$  is  $\theta$ -sgp-normal then there exist  $\theta$ -sgp-open sets  $U$  and  $V$  of  $X$  such that  $U \cap V = \phi$ ,  $G^c \subset V$  and  $F \subset U$ ,  $U \subset V^c$ . We have  $\theta\text{-sgpCl}(U) \subset \theta - \text{sgpCl}(V^c) = V^c$ . Hence  $F \subset U \subset \theta - \text{sgpCl}(U) \subset V^c \subset G$ .

**Theorem 5.10.** A  $\theta$ -sgp-closed subspace of a  $\theta$ -sgp-normal space is  $\theta$ -sgp-normal.

**Proof.** Let  $X$  be a  $\theta$ -sgp-normal space. Let  $Y$  be a  $\theta$ -sgp-closed subspace of  $X$ . Let  $A$  and  $B$  be a pair of disjoint  $\theta$ -sgp-closed sets in  $Y$ . Then  $A$  and  $B$  are disjoint  $\theta$ -sgp-closed sets in  $X$ . Since  $X$  is  $\theta$ -sgp-normal, there exist disjoint semi-open sets  $G$  and  $H$  in  $X$  such that  $A \subseteq G$  and  $B \subseteq H$ . Since  $G$  and  $H$  are semi-open in  $X$ , then  $Y \cap G$  and  $Y \cap H$  are semi-open in  $Y$ . Also we have  $A \subseteq G$  and  $B \subseteq H$  which implies  $Y \cap A \subseteq Y \cap G$ ,  $Y \cap B \subseteq H$ . So  $A \subseteq Y \cap G$ ,  $B \subseteq Y \cap H$  and  $(Y \cap G) \cap (Y \cap H) = Y \cap (G \cap H) = \phi$ . Thus for each pair of disjoint  $\theta$ -sgp-closed sets  $A$  and  $B$  in  $Y$ , there exist disjoint semi-open sets  $Y \cap G$  and  $Y \cap H$  such that  $A \subseteq Y \cap G$  and  $B \subseteq Y \cap H$ . Hence  $Y$  is  $\theta$ -sgp-normal.

**Theorem 5.11.** Let  $X$  be a topological space. The following statements are equivalent: (i)  $X$  is  $\theta$ -sgp-normal.

(ii) For each  $\theta$ -sgp-closed set  $A$  and each  $\theta$ -sgp-open set  $U$  such that  $A \subseteq U$ , there exists a semi-open set  $V$  such that  $A \subseteq V \subseteq pCl_\theta(V) \subseteq U$ .

(iii) For each pair  $A, B$  of distinct  $\theta$ -sgp-closed sets there exists a semi-open set  $V$  such that  $A \subseteq V$  and  $pCl_\theta(V) \cap B = \phi$ .

(iv) For each pair  $A, B$  of distinct  $\theta$ -sgp-closed sets there exists a semi-open sets  $U$  and  $V$  such that  $A \subseteq U$ ,  $B \subseteq V$  and  $pCl_\theta(U) \cap pCl_\theta(V) = \phi$ .

**Proof.** (i)  $\rightarrow$  (ii) : Let  $A$  be a  $\theta$ -sgp-closed set and  $U$  be a  $\theta$ -sgp-open set such that  $A \subseteq U$ . Then  $A$  and  $X-U$  are disjoint  $\theta$ -sgp-closed sets in  $X$ . Since  $X$  is  $\theta$ -sgp-normal, there exist disjoint semi-open sets  $V$  and  $W$  in  $X$  such that  $A \subseteq V$  and  $X-U \subseteq W$ . Now  $X-W \subseteq X-(X-U)$  that is  $X-W \subseteq U$ . Also  $V \cap W = \phi$ , which implies  $V \subseteq X-W$  implies that  $pCl_\theta(V) \subseteq pCl_\theta(X-W)$  that is  $pCl_\theta(V) \subseteq X-W$ . Therefore  $pCl_\theta(V) \subseteq X-W \subseteq U$ . So  $pCl_\theta(V) \subseteq U$ . Hence  $A \subseteq V \subseteq pCl_\theta(V) \subseteq U$ .

(ii)  $\rightarrow$  (iii): Let  $A$  and  $B$  be a pair of disjoint  $\theta$ -sgp-closed sets in  $X$ . Now  $A \cap B = \phi$ , so  $A \subseteq X-B$ , where  $A$  is  $\theta$ -sgp-closed and  $X-B$  is  $\theta$ -sgp-open. Then by (ii), there exists semi-open set  $V$  such that  $A \subseteq V \subseteq pCl_\theta(V) \subseteq X-B$ . Now  $pCl_\theta(V) \subseteq X-B$  implies  $pCl_\theta(V) \cap B = \phi$ . Thus  $A \subseteq V$  and  $pCl_\theta(V) \cap B = \phi$ .

(iii)  $\rightarrow$  (iv): Let  $A$  and  $B$  be a pair of disjoint  $\theta$ -sgp-closed sets in  $X$ . From (iii), there exists a semi-open set  $U$  such that  $A \subseteq U$  and  $pCl_\theta(U) \cap B = \phi$ . Now

$pCl_\theta(V)$  is  $\theta$ -sgp-closed set and  $B$  is  $\theta$ -sgp-closed set. Therefore again from (iii), there exists a semi-open set  $V$  such that  $B \subseteq V$  and  $pCl_\theta(U) \cap pCl_\theta(V) = \phi$ .

(iv)  $\rightsquigarrow$  (i) : Let  $A$  and  $B$  be a pair of disjoint  $\theta$ -sgp-closed sets in  $X$ . Then from (iv), there exists a semi-open sets  $U$  and  $V$  in  $X$  such that  $A \subseteq U, B \subseteq V$  and  $pCl_\theta(U) \cap pCl_\theta(V) = \phi$ . So  $A \subseteq U, B \subseteq V$  and  $U \cap V = \phi$ . Hence  $X$  is  $\theta$ -sgp-normal.

## 6. Conclusion

The notions  $\theta$ -sgp-open,  $\theta$ -sgp-closed maps,  $\theta$ -sgp-regular and  $\theta$ -sgp-normal spaces have been introduced and investigated their properties. Compact and connected spaces may be discussed in future using  $\theta$ -sgp-closed set.
